Dehumidifiers serie DAC

Small compressed air dryers, **equipped with two cartridges of molecular sieves**, in which air flow is alternately exchanged from one tower to the other one. DAC dryers enhance great performances in the treatment of hygroscopic engineering materials.

The series includes 4 sizes of dryers, covering a capacity from **6 to 100 dm³**, suitable to carry out throughputs **up to 25 Kg/h**. These small dryers take advantage from both the effusion of compressed air onto the atmospheric pressure and from the treatment of compressed air by means of molecular sieves, in order to reach **Dew Point values to -25 °C up -50°C**. DAC series dryers are ideal to be installed directly on the top of small and medium injection moulding machines, representing also a liable solution in the medical sphere, thanks to the set of dedicated applications.

Important advantages of the standard version:

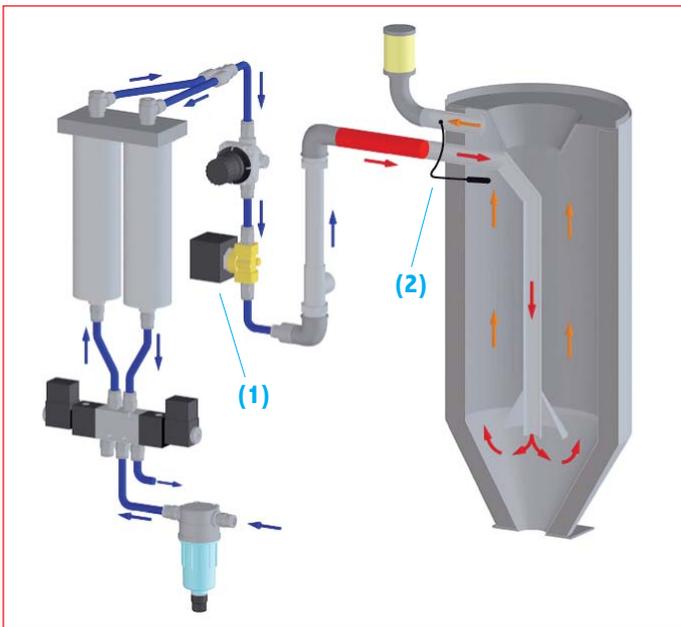

- Easier programmation, **setting only two parameters** (material type & machine hourly consumption)
- **Mould maintenance** cycles reduced of 30%
- **Automatic anti-stress** device, enable to parcel process air, preventing overheating of material granules resident inside the hopper, as well as energy and compressed air wasting **(2)**

Standard devices:

- Microprocessor LCD display panel control
- Drying time management valve with automatic setting of airflow, according to the material throughput **(1)**
- Weekly timer
- RS485 ModBus Communication interface
- Visual alarm
- Manual sliding gate
- Filter for oil separation
- Plug for external dew point connection

Options:

- HC hand control
- Dew Point device integrated
- Portable Dew Point device
- Venturi feeder
- Pyrex base (DAC6 -15)
- Base with discharge (DAC 30-100)
- Medical version
- Carbon filter for DAC air inlet

Dehumidifiers serie DW

DW dehumidifiers series, equipped with honeycomb desiccant rotor technology represent a new top level performance in dehumidifying systems, optimizing energy consumption and energy maximum efficiency and duty versatility.

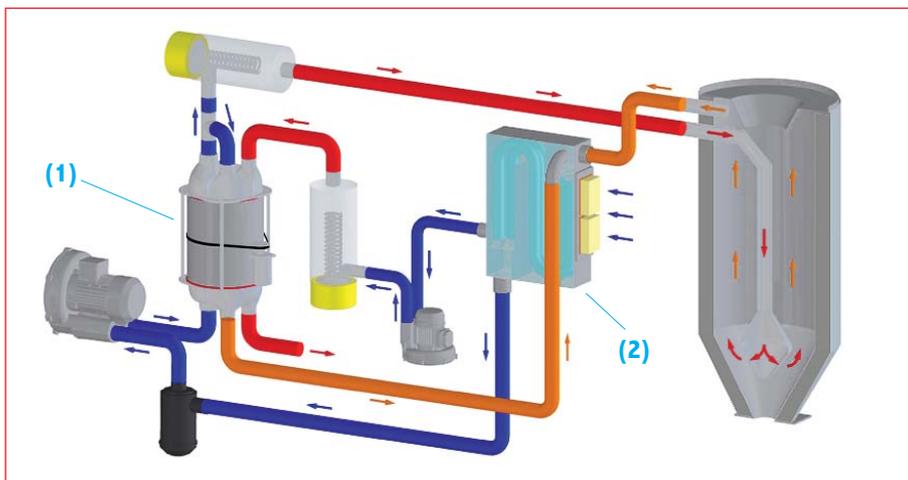

Models DW maintain a constant Dew Point value to - 25 °C up 50 °C thanks to the desiccant molecular sieves rotor technology with air flow rate from 30 to 600 m³/h. Special peculiar characteristics of this new series make it suitable to be used on medical and food applications (fields, sectors), ensuring great advantages and upstanding features recognizable also in the base version.

Standard Feature:

- Microprocessor control unit with LCD display, easier programmation, setting only two parameters (material type & machine hourly consumption)
- Molecular sieves honeycomb rotor technology **(1)**
- PID electronic control of process temperature with automatic presetting of the safety temperature
- Integrated energy saving devise **(2)**
- Internal stainless steel heating chamber insulated
- Side channel blowers for process & regeneration
- Process filter
- Regeneration filter
- Weekly timer
- Solid state relays (SSR) for heating the process
- RS485 ModBus
- Warnings lamp
- Multi-hoppers DTM interface

Options:

- Air Process flow rate control by inverter
- Dew point instrument monitoring and control system with alarm
- Operator touch screen panel
- Acoustic alarm
- Hand controller HC
- Clogged filter pressure switch
- Dedicated process air temperature safety control
- Portable Dew Point
- Plug for external Dew Point connection
<75 °C >150°C recommend heater exchanger for temp.

Dehumidifiers serie DWCompact

The new compact dryer series **DWC** use honeycomb desiccant rotor that guarantees a superior process performance to the drying process with few parameters set by the operator.

DWC integrate the hopper and feeding system to adjust the production according the requests of the moulding machine considering all the drying factors.

This new range od DWC include 3 models from 70 to 280 mc/h and can individually operate or centralized for the preparation of more materials controlled by one touch screen. Dew Point -25°C up to 50 °C.

Beside the standard features the DWC include:

- Air Process flow rate control by inverter
- Machine & hopper feeding control
- Material level control by load cells
- Material anti stress control
- Drying time release
- Batch production
- Modular systems

Options:

- Touch screen
- Dew Point device
- DWC feeders
- DWC Multi-Touch

Touch control unit up to 8 multi DWC

Dehumidifiers serie D

Plastic Systems **D** series desiccant dryers are designed and implemented in order to remove moisture absorbed in hygroscopic thermoplastic granular materials. The range include a series of models, with process air flow ranging from **80m³/h up to 500m³/h**, suitable to satisfy every requirement in production. With dew point up to - 50°C.

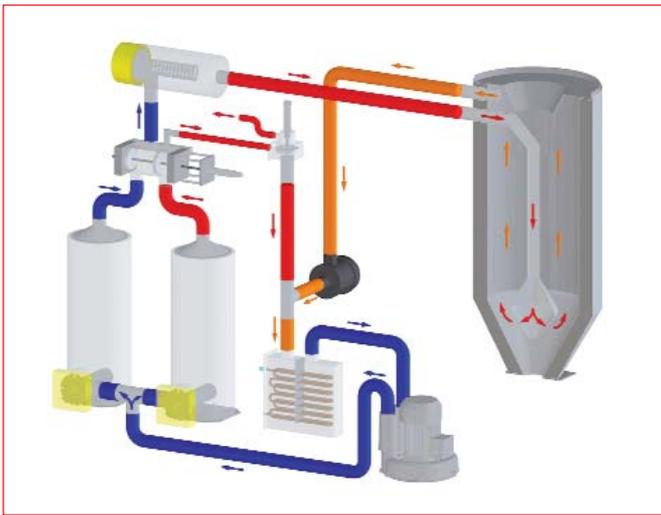

The main technical features of the standard desiccant units are: machine automatic running with daily-weekly timer; microprocessor control panel with LCD or **PLC** display and keypad (optional); the main components are in contact with process air made in stainless steel; high-head lownoise side-channel blowers; filters for air with high filtering capacity; safety protections to save components from over-heating; end-user interface with keypad, **LCD or “Touch Screen” display**; possibility to couple the desiccant dryer with a wide range of maintenance hoppers, from 15 up to 1500 litres; stainless steel hoppers with thickness of insulation from 60 to 100 mm.

Standard version main technical features:

- **Only two parameters** to set the working process (material type & consumption/h)
- **Cooling stop’** device, to set automatically stop time, avoiding thermo-degradation of material granules in process
- Mono- or multi- hoppers systems design, with **DTM drying time management** interface
- Close loop regeneration circuit equipped with temperature control, enhancing a lower energy consumption, with energy saving up to 50% (DP version)

Options:

- Operator touch screen panel
- Acoustic alarm
- Hand controller HC
- Clogged filter pressure switch
- Dedicated process air temperature safety control
- Portable Dew Point
- Plug for external Dew Point connection
- Dew Point control

Deumidificatori serie DP

Plastic Systems **DP** series desiccant dryers are designed and implemented in order to remove moisture absorbed in hygroscopic thermoplastic granular materials. The series includes a large scale of models, with process air flow ranging from **80m³/h up to 5000m³/h**, suitable to satisfy every requirement in production. Hi-tech technological solutions and constant screening have brought to obtain the best performance in terms of high efficiency in use of molecular sieves, enhancing also a lower energy consumption.

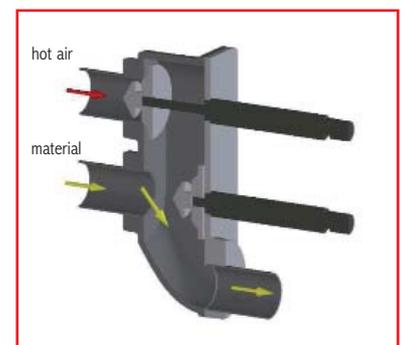

The main technical features of the standard desiccant units are: machine automatic running with daily-weekly timer; microprocessor control panel with LCD or **PLC** display and keypad (according to the model); main components in contact with process air made in stainless steel; high-head lownoise side-channel blowers; filters for air with high filtering capacity; safety protections to save components from over-heating; end-user interface with keypad, **LCD or "Touch Screen" display**; possibility to couple the desiccant dryer with a wide range of maintenance hoppers, from 15 up to 15000 litres; stainless steel hoppers with thickness of insulation from 60 to 100 mm.

* heating booster on board hopper

Accessories series DW & D/DP

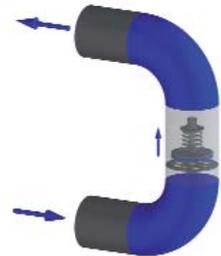

Plastic systems complete his range of dryers with advantages performance gadget for centralized application.

Multi-hoppers systems are equipped with **“Visu”** simplified operator interface, to visualize process and working temperature, as well as safety temperature with double probe automatic setting and **type of material in process inside the dehumidifying hopper.**

DTM drying time management **to manage airflow rate** according to production output in each dehumidifying hopper, simplifying the two parameters (material type and throughput) programming operations. Through this device the two parameters (material type and throughput) can be set directly from the dryer display or from HC hand control. Process and safety temperature are automatically set by microprocessor.

integrated by pass valve between delivery & return dry air

Anti-Stress through this device airflow rate is automatically reduced according to the machine throughput, enhancing a lower energy consumption. Original parameters are automatically reset at machine full working capacity.

* heating booster on board hopper

Central Drying & Feeding systems

The drying system can be floor standing or positioned on a mezzanine. A typical system includes larger dehumidifying units supplying dry air to multiple groups of hoppers.

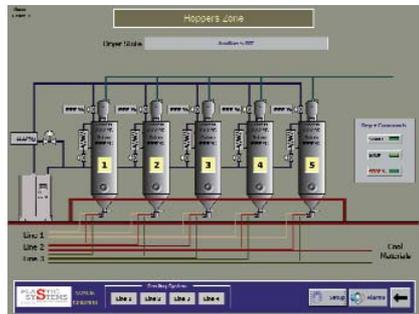

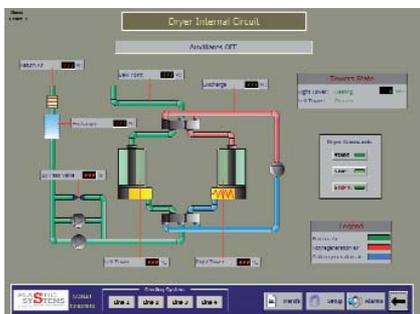

Individual heating units can be fitted to each drying hopper to allow several materials to be dried at different temperatures within the same system.

Material selection is generally made via manual or automatic manifold

Supervision

More and more care has been taken over the control of our auxiliaries (dryers, feeders, dosing units, etc.) by improving our Supervision system. This system has a graphical interface that enables to visualize and monitor the status of the different units (filling, functioning, alarms and historical trends), to set the main parameters and to arrange the different types of materials used in the plant through a Material Database (it contains data about supplier, stockage time, drying temperature and other information). A special program (available as option) enables the remote control of Supervisor PC via modem: an authorized computer can be connected to the customer's Supervisor PC and view Plastic Systems Supervisor windows.

Estrusion systems

Plastic Systems offers a wide range of auxiliaries and treatment systems for extrusion lines, as well as software to monitor and set-up all machines. The close cooperation with **OEM** allows Plastic Systems to adopt the most competitive and personalized solutions to manufacture tubes, films, profiles, cables, fibres and other products, with the purpose of meeting the customer's requirements.

Dehumidifier with **Moved** Crystallizer

Impianti PET

Plastic Systems è in grado di fornire una vasta gamma di ausiliari e sistemi di trattamento per impianti di estrusione, ai quali si possono integrare software per il comando e la supervisione di tutti gli apparati.

La stretta collaborazione con costruttori **OEM** consente di ottenere soluzioni adeguate per la manifattura di tubi, film, profilati, cavi fibre e altri prodotti che riescono a soddisfare le esigenze del cliente.
